Attended site to carry out a Major Maintenance on all Air Conditioning equipment.

This included the following works carried out:

- Filters from units were removed from each unit, cleaned, and put back in place.
- Coils on all outdoor condensers were cleaned of any heavy dirt to prevent a restriction of air flow and reduce the head pressure of the compressors.
- Electrical connections on both indoor and outdoor units were checked for any signs of damage.
- Drains were tested to ensure all condensate water leaves the unit freely with no signs of leaks or blockages.
- Pipework connections were checked for traces of oil, visual leaks or damage.
- Checked all indoor and outdoor unit fan motors for any abnormal noise and ensured they can rotate free of obstruction.
- All controllers were checked for damage and tested all functions were operating correctly.
- The systems were then tested in both full heating and full cooling. All off coil temperatures were recorded to ensure the set point was being reached. While the system was operational, amps, voltage readings and pressures were recorded.
- Daikin Service Checker was connected to Outdoor units to ensure all temperatures and pressure were achieved at a desirable level. Outcomes on these results all passed service checks and no abnormal occurrence were detected.

All systems were F. Gas checked, and the F. Gas log has been updated accordingly.

Issues / Recommendations:

-Access Hatches in Open Plan Area need better access to support maintaining units electrical panel as it can be difficult to access.

-Damaged Filters
