	Total Excludes VAT @ 23%		€4,770.00

3. Scope of Works

3 x Sample Per Visit (including ice machine)

5 x sample Per Visit

"At AquaChem we use AquaSil for the Cleaning and Disinfection of cold-water storage tanks. The advantages of AquaSil over conventional Chlorine as a method of cleaning and disinfection are as follows:

Water Savings - The cold-water storage tanks do not require a second drain down as is with the case of conventional chlorine cleaning and disinfection method. This allows site to save money by not needing a second refill on the cold-water storage tanks.

Extremely Effective Biocide - far more effective than Chlorine.

Wide Spectrum, No-Gap Biocide - sanitising disinfectant effective against all bacteria, viruses, fungi and algae, a simple 'one-stop' approach.

Destroys Biofilm - unlike chlorine, AquaSil removes the protection that Biofilm affords to bacteria and viruses. This is partially beneficial in an old system.

Long Term Effectiveness - has a long-lasting residual effect in water and remains stable at high water/air temperatures; its effectiveness actually increases at high temperatures.

AquaChem's Cleaning and Disinfection services include the following:

Cleaning and disinfection of the cold water storage tanks and associated hot and cold water down services as detailed above.

Full report and certification and recommendations are issued on completion of the cleaning and disinfection work.

The supply of all chemicals.

The supply of all labour and materials.

Full monitoring during and after disinfection."

"In Ireland, under occupational Health and Safety legislation, there is a legal obligation on employers to carry out a risk assessment in relation to legionella prevention and control in the workplace

An Aquachem Risk Assessment will include the following:

Inspection of the water storage tanks to ensure they are compliant with all relevant information.

Inspection of water heaters and calorifiers to ensure they comply with all relevant legislation.

Inspection of water distribution systems to ensure they comply with all relevant legislation.

Temperatures would be taken from around the site to ensure they are not at a level to promote the growth of bacteria.

Asset register.

Digital photographs will be included of the main pieces of plant.

Responsibility Structures.

Recommendations will be included of remedial work that is required to bring the system within the guidelines as set out in the HPSC 2009 guidelines.

Water Hygiene Logbook."
